## Explanation

**Maximum Drawdown** refers to the maximum percentage of loss of the mutual fund over the past five years (or since inception if the fund has been established less than five years), as measured from NAV per unit from peak to trough when NAV per unit declines. Maximum Drawdown is the information that helps determine the risk of loss from investing in the mutual fund.

**Recovering Period** refers to the recovering period as information for investors on how long it will take for the fund to recover, measuring from the point of maximum loss to the point of recovery of initial investment.

**FX Hedging** refers to the percentage of investments denominated in foreign currencies and are hedged against foreign exchange risk.

**Portfolio Turnover Ratio** refers to the frequency of securities trading in the mutual fund's portfolio over a period. The calculation is based on the lower amount between the total amount of securities purchased and the total amount of securities sold within a one-year period, divided by the average NAV of the mutual fund in the same period. The mutual fund with a high Portfolio Turnover Ratio indicates the higher frequency of securities trading by the fund managers, causing higher cost of securities trading. Therefore, the ratio must be compared with the mutual fund's performance to assess the worthiness of such securities trading.

**Sharpe Ratio** is the ratio between the mutual fund's marginal return compared with its investment risk, calculated from the difference between the rate of return of the mutual fund and the risk-free rate, in comparison with the mutual fund's standard deviation. The Sharpe Ratio reflects the increase in the rate of return that the mutual fund should receive to compensate the risk received by the mutual fund. A mutual fund with a higher Sharpe Ratio will indicate better investment management efficiency as it has higher returns under the same risk level.

**Alpha** refers to the excess return of a mutual fund upon comparison with the benchmarks. Having high Alpha means the fund can generate higher returns than the benchmarks, due to the efficiency of the fund managers in selecting or finding an appropriate timing to invest in securities.

**Beta** refers to the level and direction of changes in the rate of return of securities in the mutual fund's investment portfolio by comparing with market movements. Beta lower than 1 indicates that the change in the rate of return of the securities in the investment portfolio is lower than market movements for that group of securities and vice versa.

**Tracking Error** indicates the effectiveness of the fund's returns in tracking the benchmarks. If the Tracking Error is low, it means that the mutual fund is efficient in generating returns close to the benchmarks. A mutual fund with high Tracking Error will have the average return deviating more from its benchmarks.

**Yield to Maturity** refers to the rate of return on investment in debt instruments held until maturity. It is calculated based on the interests to be received in the future throughout the lifespan of the instruments and the principals to be repaid, discounted as the present value. It is used to measure the rate of return of a fixed income fund, calculated from the weighted average of yield to maturity of each debt instrument in which the fund invested. Since the yield to maturity is in percentage per year, it can be used to compare the rates of return between fixed income funds with an investment policy to hold debt instruments until maturity and with similar investment characteristics.
