GLOSSARY

- Maximum Drawdown** the fund’s largest percentage loss over the past 5 years (or since inception if the fund has been operating for less than 5 years) measured from peak NAV/unit to lowest NAV/unit during a decline. The Maximum Drawdown helps provide some indication of the risk of potential loss when investing in the fund.
- Recovering Period** the time it takes to regain losses; this data provides information about how long it took to climb back from the largest loss to a former peak.
- FX Hedging** the percentage of foreign investments that are hedged against foreign exchange risk.
- Portfolio Turnover Ratio** illustrates how active the portfolio is traded during a particular period. This is calculated by dividing the value of total purchases in 1 year or the value of total sales in 1 year, whichever is lower, by the fund’s average NAV over the same period being measured. A fund with a high Portfolio Turnover ratio denotes that its portfolio managers actively trades the securities in the portfolio; this incurs considerable trading costs which should be taken into consideration in comparison with the performance of fund to ascertain whether the active trading activity is well justified.
- Sharpe Ratio** the ratio between excess return achieved by the fund compared to investment risks taken. It is determined from the difference between the fund’s return and the Risk-Free Rate, compared to the fund’s volatility (Standard Deviation). The Sharpe Ratio reflects the excess return the fund generates given its risk exposure. A fund with a higher Sharpe Ratio denotes a better-managed fund since it is able to generate a higher return over a similar risk exposure.
- Alpha** excess return generated by the fund when compared to its benchmark index. A high Alpha figure illustrates that the fund is able to achieve a higher return than the benchmark due to the fund managers’ ability to select good investments and appropriate timing.
- Beta** magnitude and direction of the performance of securities in the portfolio relative to the market’s return. A Beta lower than 1 denotes that the return of the securities in the portfolio is less sensitive to changes in the market’s return. A Beta higher than 1 indicates that the return of the securities in the portfolio deviates by a larger magnitude in comparison to changes in the market’s return.
